Area grows like $\kappa\phi(\kappa)\ln(1/\delta)$: visible only for small κ
area under eq. (14)
lower limit δ (integrate (14) over $z > -\kappa + \delta$)
σ_s=0.12, σ_R^2=0.1 (κ=21.5)
σ_s=0.12, σ_R^2=0.5 (κ=48.2)
σ_s=0.12, σ_R^2=1.0 (κ=68.1)
σ_s=0.25, σ_R^2=0.1 (κ=5.0)
σ_s=0.25, σ_R^2=0.5 (κ=11.1)
σ_s=0.25, σ_R^2=1.0 (κ=15.7)
σ_s=0.35, σ_R^2=0.1 (κ=2.5)
σ_s=0.35, σ_R^2=0.5 (κ=5.7)
σ_s=0.35, σ_R^2=1.0 (κ=8.0)
Accuracy is governed by one number, κ
Δ at HD-FEC [dB] (floored at 10^{-4})
$\kappa = \gamma^2\sigma_R$
Δ_{17} (this work, $\delta = 10^{-6}$)
Δ_{17} ($\delta = 0.1$)
Δ_{17} read from paper Fig. 2
|Δ| bounded-Q remedy
